ShotProof

Image comparison with reviewable evidence

Creative quality control for product-content teams

Actual AMD MI300X image inference, synthetic fixtures

The review problem

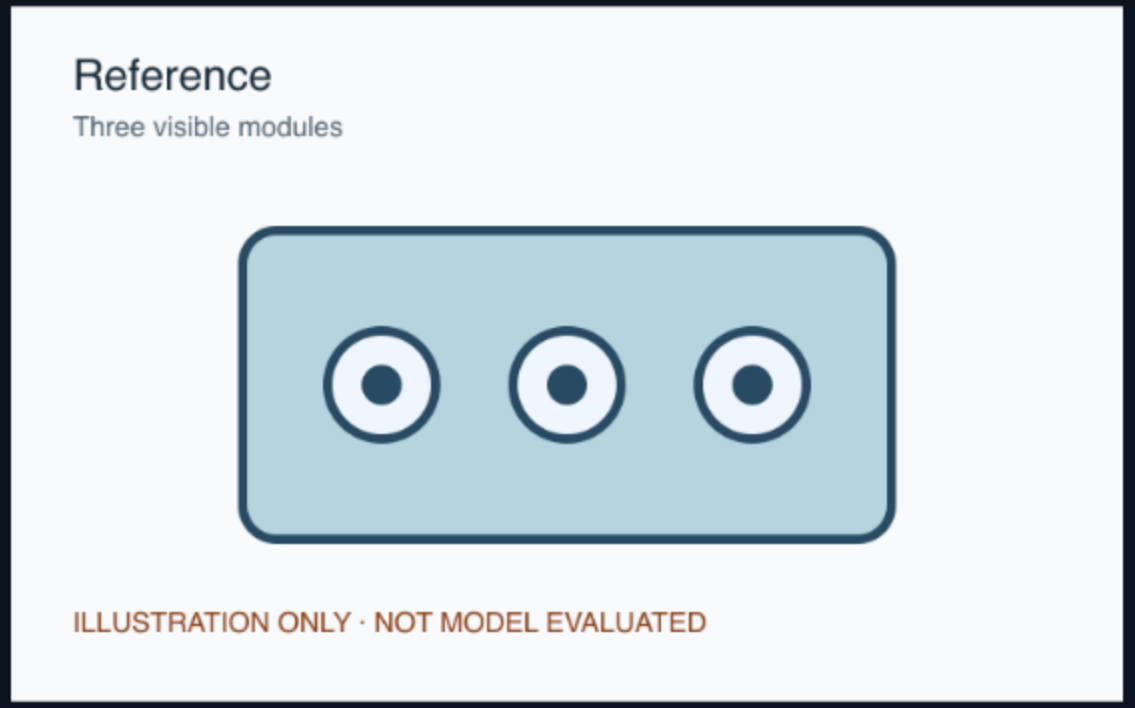

A changed product detail can slip into creative content

Reviewers need to see the reference, inspect the candidate and retain the reason for their decision.

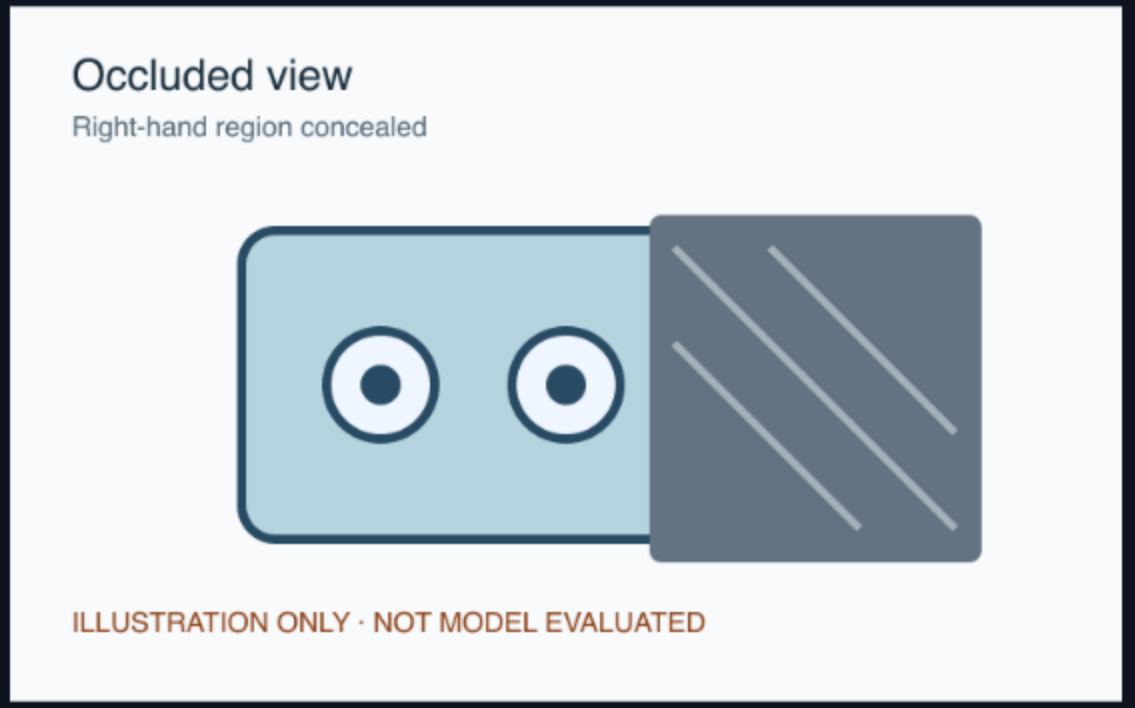

Occlusion needs an uncertain answer. A concealed component cannot be counted as absent.

Original images, explicit uncertainty

Selected reference

Candidate with occlusion

A reviewer records what is visible and what remains unverifiable

The paired-image workflow

01	**Two images**	The gateway sends the reference and candidate pixels together.
02	**Model proposal**	Structured findings preserve uncertainty and visible limitations.
03	**Evidence record**	Hashes, model, request status and usage identify the actual call.
04	**Reviewer decision**	A reviewer records a reason. Agent demo annotations carry a separate identity.

Actual AMD execution and remaining limits

Qwen2-VL-7B on AMD MI300X VF

Three interactive image pairs completed. Their single-request generation times were 1.40, 1.28 and 1.57 seconds.

Synthetic examples, human review required

These single requests establish a working GPU path. They do not establish accuracy or customer benefit.
